

Options: Automatic lubricating system

For the automatic lubrication of the main bearings of the D-Series, Westtrack supplies a purpose-designed automatic lubricating system. This lubricating system provides a constant optimal lubrication of the main bearing.

Limiter set

To prevent the frames from the C or D Series from tipping over, Westtrack has developed a limiter set, which is available as an option. All frames from this series have been prepared in such a way that the limiters can be easily mounted.

Reduction pieces

To make your track units suitable for different machines, Westtrack can design and produce customised attachments, allowing you to maximise your investment.

Track wideners

If you prefer a specific track width, Westtrack can produce customised attachments, which are available as an option. The units can thus be used for as many track widths as you like. This option depends on the type of track unit.

Westtrack: specialist in rubber track systems

With over 35 years experience in the construction of agricultural and building machinery, Westtrack develops and produces entirely under its own management many models and types of track units for tractors and self-propelled machines. These developments, backed up by CAD 3D technology, have enabled Westtrack to acquire a wealth of knowledge and experience in track systems, which are successfully applied in agriculture, earthworks, horticulture and land development.

WESTTRACK
RUBBER TRACK SYSTEMS

Lower ground pressure means higher yield

A set of track units mounted on your machine will lead to a ground pressure reduction of up to 75% compared to a similar tractor with tyres of the same width. The structure of the soil in which the seeds are sown and planted is left completely intact. The growth of the crops is not obstructed, ensuring qualitative and quantitative crop improvements.

With tracks more traction

Since Westtrack's track units have a much larger area of contact with the ground than normal pneumatic tyres, the tractive power of machines equipped with this system will increase considerably. A rubber track has up to four times as many studs that are in contact with the ground, while the track does not flood thanks to the self-cleaning capacity of the rubber track. When negotiating bends and obstacles, the four track units always take the most ideal position, ensuring the best possible distribution of weight and excellent traction.

Your tractor as a caterpillar tractor

Westtrack has developed a series of track units that can be used on almost any wheel tractors and self-propelled machines. The wheels can be easily replaced within 60 minutes with track units without having to make any drastic changes to the machine. If required, you can quickly change back to standard wheels, thus returning the tractor to its original use. All components on the tractor, such as lifting device and power take-off, can still be used, as well as front-end loader or front-lift.
